At its heart is the common C language. It is a free, open-source programming language for systems programming that was developed in the early 1970s by Dennis M. Ritchie at AT&T Bell Labs in Bell Labs. The first C compiler that it was developed in the 1980s at Bell Labs to produce executables for the PDP-11 was released on November 2, 1983. This was further extended to other architectures and operating systems, such as Unix, OS/2, Windows, and others. The first C compiler for MS-DOS followed in 1987. The Kildall Workshop first released the first C compiler for the 28k (K) x 86 processor family in 1991. C++ was developed as a language from the C programming language, and it primarily adds object oriented programming features.

For lots of picture-editing programs, the “toolbox” — the set of modules available for performing specific tasks — is more a collection of plugins: third-party little bits of software that augment the program and/or work within its confines. The new updates make my life easier and my photos look great. It’s still the software I use to make my pictures sing. With the new updates, of course, that may no longer be true. Still, many people will find that Photoshop remains a strong contender for their PC in the multimedia realm. Google updated its Accelerated Mobile Pages provides lean instruction for how to build websites that load in the blink of an eye on mobile gadgets. The big change this time? It’s a global update, so the docs are now in local languages, too. History, just for the sake of history: Accelerated Mobile Pages was the precursor to AMP, which first debuted in June 2016. Back then, we hailed AMP as Google’s most sophisticated bounded site-building system yet. The company has made tweaks to the system ever since, especially regarding mobile sites. The Google AMP Project was launched at Google I/O 2016, with the goal of making web content leaner and loading up to 25 times faster. This is how Adobe sees Creative Cloud evolving over time: you’ll pay for it up front, use it for a while, and then “unsubscribe” to save on ongoing fees. If you want to support your latest hardware investment with a monthly subscription, such as a large phone, monitor, printer, or storage drive, there will be a starting point for the first year, then yearly rates thereafter. This lets Adobe keep its subscription fees down while offering enough throat-room for growth. I’m generally unhappy with this kind of thinking, but Creative Cloud does make sense for Adobe to grow the hardware portfolio on its own, without burning customers on upgrades they can’t afford. Needless to say, my latest Core i5 Mac works just fine, but I’d prefer to get it running a faster CPU and SSD, a bigger RAM stick, and better graphics.
