It's not a huge deal, but it can be annoying : When you click on a RAW file in order to view it, the file extension disappears from the filename. For example, if you have a.hdr file, it's displayed as "7bit."hdr." Adobe is still trying to get everything ready, so it's not a showstopper. There are many other issues with the app above and beyond the file extension getting, too, many of which are due to the fact that the app is still in beta after nearly three years. In fact, I know of a lot of people who have patiently waited for X-Pro II people for this to be finished rather than buy it from the Apple store. I don't know if that will be the case forever, but it's quite disheartening. Adobe has worked to make the effects sliders more easily accessible. Previously, it was very difficult to locate the effects sliders. To enhance their visibility, Adobe has kept the contrast slider at the top right side of the tools palette. The filter preview font is now easily accessible. It's also easier to make entirely new luma-saturated and desaturated images. I would still suggest learning how to create, and more importantly, how to enhance, the existing colors in a particular image. However, it's much easier than it used to be. Adobe has revamped the color palette, with a new display of possible colors of the Curves dialog. I also like the new preview window improvements. In fact, it's almost exactly like a lightbox. It's possible to reorient this window in any orientation. It doesn't all work on one screen. In fact, it is limited to one screen if you have dual monitors, but can be accessed full-size on a single monitor. I don't have enough room for that in my home office.
